

30-Day AI Faceless YouTube Launch Plan

Modeled on 如见未来AI ("cinematic emotional AI shorts") — built for YouTube + ViewMax

0. Read this first: what "\$15k/month" actually requires

The reference channel makes 60–90 second emotionally-charged AI mini-films (a strong hook, a human-interest story, a punchy "twist" line at the end). It works because each film *says something* — not because it floods the feed. Copy the DNA, not the volume.

The honest revenue math:

Lever	Realistic timeline	Notes
YouTube Shorts ad revenue	Month 3–6+	Shorts pay ~\$0.03–\$0.10 / 1,000 views, creator keeps 45%. \$15k on Shorts alone ≈ 100M+ views/month. Slow.
YouTube long-form ad revenue	Month 4–8+	Higher RPM (\$2–\$8 in good niches, 55% share), but needs watch hours + retention.
Digital product (prompt packs / "how I make these" mini-course)	Month 2–3	The fastest lever. 300 sales × \$50 = \$15k. This is how most people in this niche actually hit the number.
Affiliate (AI tools, ViewMax, editing gear)	Month 2–4	Compounds with audience.
Channel-for-hire / UGC ads for brands	Month 1–2	You can sell the <i>skill</i> before the channel is big. \$500–\$2k per client video.

Threshold reality (verify in YouTube Studio → Earn):

Now → Jan 31, 2027: 1,000 subs + (10M Shorts views/90d **OR** 4,000 watch hours/12mo) for full ad revenue. Fan-funding tier at 500 subs + (3M Shorts views **OR** 3,000 watch hours).

From Feb 1, 2027: new creators need 8,000 watch hours **or** 20M Shorts views/90d. **Existing Partner Program members are grandfathered in.** → Getting monetized *before* Feb 1 is worth real money. That's the clock this plan races.

Target model for a realistic first \$15k month (≈ month 4):

~\$3k YouTube ad revenue (Shorts + a few long-form)

~\$7k digital product sales

~\$3k affiliate

~\$2k one or two brand/UGC deals

30 days gets you the **engine, the catalog, and the first traction** — not the \$15k. Anyone promising \$15k in 30 days from a cold start is selling you the course, not the result.

1. Pick your lane (the format)

Translate the reference's emotional-cinematic DNA into a YouTube-legal, English-audience niche. Pick ONE to start — a channel with one clear promise grows faster and monetizes cleaner.

Recommended: "Untold moments" cinematic emotional shorts. Short AI films built around a single resonant human story + a one-line gut-punch ending. Universal themes travel across borders and dodge the copyright/originality traps: sacrifice, reunions, the last day of something, an unseen act of kindness, a hard choice. This is closest to the reference and plays globally.

Strong alternatives (all fit ViewMax's built-in story workflow):

AI animal rescue / survival stories — huge on Shorts, ViewMax has a purpose-built "found-footage narrated story" workflow for exactly this. Warning: saturated, so lean hard on writing quality.

"What if history went differently" cinematic scenarios — high retention, low competition, evergreen.

Mythology / folklore retold — beautiful visuals, built-in story structure, low IP risk if you use public-domain sources.

Positioning rule to survive YouTube's originality bar: every video needs original narration/script + a distinct visual style + a point of view. Never post the same template with swapped nouns. That's what gets AI channels demonetized.

This is the repeatable assembly line. The story workflow does most of the heavy lifting.

Per-video pipeline:

Script (free, do it yourself or with me): Hook in first 2 seconds → build → one-line twist. 90–130 words for a ~60–75s short.

Kick off the Story Workflow — start here every time; it locks camera style, character continuity, and shot durations *before* generating, which is what keeps AI video from looking incoherent.

Voiceover — pick one signature narrator voice from the voice picker and keep it consistent across the channel (brand recognition). Generate the voiceover; its timing becomes the spine of the edit.

Generate scene videos — the workflow tells you which model/duration per shot. Rough model guide: cinematic/photoreal → Veo-class; fast text-to-video → Kling Turbo; identity/face consistency → Seedance; creative/artistic → Sora-class. Let the workflow's default choose unless you have a reason.

Compose — assemble the master clips into one video (two-pass: glue the visuals, then overlay the single voiceover).

Captions — pick ONE caption style and reuse it channel-wide. Big, bold, centered reads best on Shorts.

(Optional) Reach 4× the audience — dub the finished film into Spanish / Hindi / Portuguese and post to separate language channels. Same asset, multiplied views. This is a genuine cheat code.

Cost discipline (video generation is 90% of your credit spend):

Run a cost estimate before any big batch; know your credits-per-video number cold.

Batch a whole week of videos in one sitting to stay in flow.

Reuse characters and style presets across videos — don't regenerate identity every time.

Keep a "winners" folder; re-cut and re-post top performers with new hooks instead of always generating fresh.

(When you're ready to actually generate, tell me and I'll drive the ViewMax tools step by step — script, story workflow, voice, compose, captions.)

3. The 30-day calendar

Assumes ~2–3 hrs/day. Volume target: **1 short/day minimum**, scaling to 2/day, plus 1 long-form/week from week 2. Cross-post every short to TikTok + Instagram Reels (free extra reach, separate monetization later).

Week 1 — Setup & first proof (Days 1–7)

Day 1: Lock your niche + channel name + one-line promise. Create the channel, set up 2-step verification, AdSense-ready Google account, banner + avatar. Turn on "notify me when eligible" in the Earn tab.

Day 2: Write 7 scripts. Define your visual style (color grade, era, mood) and your narrator voice. Consistency now = brand later.

Day 3: Run the full ViewMax pipeline on ONE video end-to-end. Goal: learn the factory, not perfection.

Day 4: Fix what broke on Day 3. Produce videos #2 and #3.

Day 5: Produce #4-#5. Design a reusable thumbnail template (for long-form) and a title formula.

Day 6: Publish your first 3 shorts (space them out). Set AI-content disclosure ON. Write descriptions with 3-5 relevant tags/keywords.

Day 7: Review analytics (retention graph is king). Which hook held? Batch next week's 7 scripts.

Week 2 — Cadence & testing (Days 8-14)

Post **1 short/day**, same time daily.

Produce your **first long-form** (3-5 min compilation of a themed set, or one deeper story) — long-form is the watch-hours path and higher RPM.

A/B test hooks: same story, two different first-2-seconds. Keep the winner's pattern.

Start a simple content tracker (title, hook type, length, views@48h, retention%, CTR). You're a backend engineer — treat this like instrumenting a service.

Reply to every comment for the first 48h of each post (early engagement signal).

Week 3 — Scale what works (Days 15-21)

Double down: 2 shorts/day on your best-performing hook/theme.

Kill formats below your median retention. Don't be sentimental.

Launch the **dubbing multiplier**: pick your single best video, dub into 1-2 languages, spin up sibling channels.

Set up the **first fast-revenue lever**: a Gumroad/Stan page with a \$27-\$49 "prompt + script pack" for your niche, linked in every description and pinned comment. (You can sell this before you're monetized.)

Reach out to 5 small brands/creators offering a paid AI promo video (your channel-for-hire pitch).

Week 4 — Optimize & compound (Days 22-30)

Analyze the month: your top 3 videos define your channel. Reverse-engineer why and make 5 more like them.

Re-cut your 3 best shorts with fresh hooks and re-post (new video, proven core).

Publish long-form #3-#4 to push watch hours.

Line up an affiliate or two (AI tools you actually use).

Day 30 review + next-30 plan: measure against the gates below, decide scale-up vs pivot.

4. Growth mechanics (non-negotiables)

Hook in 2 seconds or you're dead. Open on the most striking image or the most provocative line. No logos, no slow intros.

One idea per video. Confusion kills retention.

Retention > everything. YouTube promotes what holds people. Watch your retention graph; every dip is a lesson.

Consistency of style + voice + posting time builds the "brand" that makes people subscribe.

Titles: curiosity gap + emotional stakes. Front-load the interesting word.

Cross-post everything to TikTok/Reels — three platforms, one asset, three shots at virality.

5. Metrics & decision gates

Track weekly. Pivot if you miss two weeks running.

Metric	Week 1	Week 2	Week 4	Green flag
Avg view retention —	>40%	>55%	>55% = format works	
Subs	0–50	100–300	500–1,500	On pace for 1k
Best-video views	1k	10k	100k+	A hit = a repeatable template
Videos shipped	5	12	30+	Volume compounds
Product page live	—	—	Yes	Revenue before monetization

The one gate that matters at Day 30: did *any* video break out (100k+ views / 55%+ retention)? If yes → you have a template; scale it relentlessly. If no → the writing/hook is the problem, not the tool. Fix the script, not the model.

6. Compliance (don't get demonetized)

Disclose AI content in YouTube's upload settings — always. Non-disclosure is a fast track to strikes.

Original contribution every time — your own script, voice, and creative arrangement. No swap-the-noun templates.

Music: use YouTube Audio Library or licensed tracks only. (Audio Library tracks split revenue with rights holders on some songs.)

No real public figures, no real quotes attributed to them, no misinformation — these torch monetization and can get a channel removed.

No reused/compilation-only content — it's routinely stripped from the revenue pool.

7. What I can do next (just ask)

Write your first 7 scripts in your chosen niche (hook + body + twist), ready to drop into ViewMax.

Drive the ViewMax pipeline live — story workflow → voiceover → scene generation → compose → captions — for your first video.

Build the content tracker as a spreadsheet.

Draft your channel-for-hire outreach and the digital-product sales page copy.

Estimate ViewMax credit cost for a week's batch so you can budget.

Pick one and we'll start.
